What shapes disease?
A cultural and socio-political enquiry for the case of diarrhoea

Supervisor : Prof .Dr .Solvay Gerke
Tutor : Dr. Subramanian Saravanan

6th PhD Scientific Seminar of the WISDOM project
Bonn, 10-14 June 2013
Rural WSS sector problematic and carries health-related risks (Reis, 2012)

Control of water pollution and implementation of current legal framework is challenging (Nguyen Thi Phong Loan, 2010)

Water consumed is contaminated (Wilbers, forthcoming)
An estimated number of 9600 – 12400 kids under 5 years of age, die from diarrheal disease each year in Vietnam (Van Man et al., 2005)

Why diarrheal disease?

- One of the leading causes of morbidity in the country (WHO, 2010)
- Increased prevalence in the Delta (Soussan et al., 2005; Luxembourger, 2001) with typhoid fever being endemic (Kelly-Hope et al., 2008)
The argument by many state officials: “When a place is urban, it gets central water supply and the sanitation is improved (latrines), thus the risk for water-related diarrheal disease is decreased and this is proven by health statistics.”
Results: Water supply and sanitation facilities

Figure 1: Water supply categories and coverage in Vietnam (1990 – 2010), for rural and urban areas (JMP 2012)

- Surface water
- Other unimproved
- Other improved sources
- Piped onto premises (central provision)

Figure 2: Sanitation types and coverage in Vietnam (1990 – 2010), for rural and urban areas (JMP 2012)

- Open defecation
- Other unimproved
- Shared facilities
- Improved facilities
Does this speak of quality & risk of disease?

- Improved or “hygienic“ - a matter of definition both for water supply and sanitation
- Simultaneous use of multiple water sources
- Pockets of poor population with no access in both R and U

Population density by MDG clean water estimate (Mekong Provinces only) - Adopted by Spencer, 2008
Results: awareness about causes and prevention

Information, Education and Communication (IEC) activities for health prevention

- Not inclusive, not widespread, not effective
- Participation not fostered
- Information dry of explanation
Nationwide yearly variation of diarrheal disease incidence (per 100,000 people) - data from (MoH, 2011)
Results: the prevalence of disease cont...

Average incidence of diarrhea in the districts of Can Tho (average for 2008 – 2011) - data from (PHC, 2011)

Incidence per 100,000 people

Binh Thuy  Cai Rang  Co Do  Ninh Kieu  O Mon  Phong Dien  Thot Not  Vinh Thanh

Variation of diarrheal disease incidence in the Southern Provinces (per 100,000 people) for 2005 and 2010 - data from (MoH, 2011)
“Health is gold”:
Institutional structures and the realities of health access in the Mekong Delta, Vietnam

Available online at the ZEF webpage: http://www.zef.de/workingpapers.html
Urban population escapes the focus of anti-diarrheal campaigns and discourse, because the issue is boiled down to WSS facilities.

This is diminishing a socio-cultural problem that the region and the country has to deal with, to an economic one.

However, in local and national reports diarrheal disease has been tackled, people are now aware and educated about these issues and take the right decisions on water and hygiene issues.

“The real disease is the reporting system in Vietnam”

(Interviewee, medical doctor 21.07.11 in Phong Dien)
Factors that exacerbate diarrheal disease act across urban and rural boundaries and are deeply political:
poverty, access to good healthcare, access to preventive health advice and the means to achieve it, opportunity to participate in activities and be part of the solutions

Simple cause-effect relationships are not enough for the assessment of diarrheal disease risk which should not be confined to WSS

Addressing this “everyday” disease in a more inclusive way, considering its social components, can have collateral positive effects for the prevention of other types of epidemics in the country.
Thank you!
